

SECURELOAD

Web-Based Loading Computer and Stowage Planner

Revolutionising Vessel Loading with Precision

- Loading softwares installed in onboarding ships to calculate its stability, strength in less than response time of 500 ms

- Ballast calculations with optimisation algorithm & 3D visualisation for precise load case configurations

- Predefined cargo templates for easy loading condition configuration and cargo planning

For more detailed information, please refer <https://secureload.app/>

Key role : Product management ,Business Analysis, Requirement Gathering

Responsibilities :

- **My Role & Task definition for Maritime project**
 - Understand marine logistics and loading requirements
 - Define product vision and strategy
 - Manage the product backlog using JIRA
 - Work with stakeholders (clients, marine engineers, software developers, QA)
 - Project Documentation with User Requirement description
 - Functional & Non Functional Requirement Specifications
 - Ensure compliance with maritime safety regulations
 - Monitor and report project progress
- **Create the Product Roadmap in JIRA**
 - Define epics (major features such as Loading Condition Configuration, Ballast calculation, Real Time Monitoring dashboard, Page login & User Access Level Definitions")
 - Break down epics into user stories (such as "As a port operator, I want to see real-time ship load balancing data")
 - Prioritize backlog items in JIRA Product Roadmap
- **Implement Scrum Framework in JIRA**
 - **Sprint Planning:**
 - Break down backlog items into tasks & subtasks
 - Feature explanation in simple layman terms for the team
 - Assign tasks to developers, marine engineers, and QA testers, UI/UX designers
 - Idea brainstorming with UI/UX for Mockup review
 - Define the sprint goal (e.g., "Optimize cargo load balancing feature")
 - Daily Standups (15 min meeting):
 - Team updates on progress
 - Identify roadblocks
 - **Sprint Reviews:**
 - Demonstrate working features to stakeholders
 - Get feedback
 - **Sprint Retrospective:**
 - Discuss what went well & areas for improvement
- **Employee Time Allocation & Monitoring**
 - Set Work Hours per Sprint
 - Burn-down charts to track sprint progress
- **Continuous Improvement & Scaling**
 - Regularly update product backlog based on feedback
 - Use JIRA reports for velocity tracking
 - Adjust time allocation based on bottlenecks
 - Integrate automation tools for efficiency
